[Title of Document] SCOPE OF CLAIMS FOR PATENT

[Claim 1]

A method for producing a fluorine-containing compound comprising reacting an organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction with an alkyl-substituted imidazolium fluoride represented by the formula (1):

[Formula 1]

wherein  $R^1$  and  $R^3$  are the same or different, and each represents an optionally substituted alkyl group,  $R^2$ ,  $R^4$  and  $R^5$  are the same or different, and each represents a hydrogen atom or an optionally substituted alkyl group.

[Claim 2]

The method according to Claim 1, wherein the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction is an organic compound wherein one or two or more hydrogen atoms on a saturated hydrocarbon, which may be substituted, are substituted with a substituent subjected to a nucleophilic substitution fluorination reaction.

[Claim 3]

The method according to Claim 1, wherein the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction is an organic compound wherein one or two or more hydrogen atoms on an

optionally substituted aromatic compound are substituted with a substituent subjected to a nucleophilic substitution fluorination reaction.

[Claim 4]

The method according to Claim 1, wherein the substituent subjected to a nucleophilic substitution fluorination reaction is a chlorine atom, a bromine atom, an iodine atom, a nitro group, a sulfo group, an optionally substituted alkylsulfonyloxy group, an optionally substituted arylsulfonyloxy group, an optionally substituted alkylcarbonyloxy group or an optionally substituted arylcarbonyloxy group.

[Claim 5]

A fluorinating agent represented by the formula (1).

[Title of Document] SPECIFICATION

[Title of the Invention] Method for producing a fluorine-containing compound

[Technical Field]

[0001]

The present invention relates to a method for producing a fluorine-containing compound.

[Background Art]

[0002]

Fluorine-containing compounds are very important compounds as various chemical products including pharmaceutical and pesticide compounds and electronic materials, and the intermediates thereof.

[0003]

Various reactions wherein a fluorine atom is introduced to an organic compound using a nucleophilic substitution reaction by a fluorine anion and various fluorinating agents for them have been developed.

As methods using potassium fluoride among the fluorinating agent, a method of substituting a chlorine atom on a chlorine-substituted nitrobenzene with a fluorine atom in an aprotic polar solvent (e.g. Non-patent document 1), a method of substituting a chlorine atom or bromine atom on various organic chloride or bromide using potassium fluoride highly activated by a spray dry method (e.g. Non-patent document 2), a method of substituting a sulfonyloxy group of a sulfonic acid ester compound with a fluorine atom using polyethylene glycol 400 as a solvent (e.g. Non-patent document 3), a method of conducting various fluorinations in the presence of an ionic solvent such as an

imidazolium salt (e.g. Patent documents 1 and 2) and the like have been known. However, all of these have some problems as industrial methods such as a low yield and selectivity of the desired fluorine-containing compound, a necessity of high temperature or long-time conditions, and a necessity of particular apparatus for spray dry.

[0004]

Meanwhile, as methods using a fluorinating agent having a quaternary salt type cation, a method using a quaternary ammonium fluoride (e.g. Non-patent document 4), a method using a quaternary ammonium fluoride in combination with cesium fluoride (e.g. Non-patent document 5) and the like have been known. However, all of them are not enough for industrial methods since a yield and selectivity of the desired fluorine-containing compound are low. Alternatively, as methods using a fluorinating agent having a relatively high fluorinating activity and a quaternary salt type cation, a method using a quaternary ammonium bifluoride (e.g. Non-patent document 6), a method using a quaternary phosphonium bifluoride (e.g. Patent documents 3 and 4) and the like have been known. However, all of them contain highly corrosive and toxic hydrogen fluoride, and hydrofluoric acid is used in the production thereof, and therefore, they are not satisfied industrially.

[Disclosure of the Invention]

[Problems to be solved by the Invention]

[0006]

So the present inventor has intensively studied in order to develop an industrially advantageous method for producing a fluorine-containing compound without using a highly corrosive and toxic compound and, as a result, he has found that a nucleophilic substitution fluorination reaction proceed efficiently by using an alkyl-substituted imidazolium fluoride as a fluorinating agent, thereby completing the present invention.

[Means for Solving the Problems]

[0007]

That is, the present invention is to provide a method for producing a fluorine-containing compound comprising reacting an organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction with an alkyl-substituted imidazolium fluoride represented by the formula (1):

[Formula 1]

(1)

wherein  $R^1$  and  $R^3$  are the same or different, and each represents an optionally substituted alkyl group,  $R^2$ ,  $R^4$  and  $R^5$  are the same or different, and each represents a hydrogen atom or an optionally substituted alkyl group.

[Effects of the Invention]

[0008]

According to the present invention, fluorine-containing aliphatic and aromatic compounds can be efficiently produced without using a highly corrosive and toxic compound, and therefore, it is industrially advantageous.

[Best Mode for Carrying out the Invention]

[0009]

First, the alkyl-substituted imidazolium fluoride represented by the formula (1) (hereinafter, simply referred to as the alkyl-substituted imidazolium fluoride (1)) will be illustrated.

[0010]

In the formula,  $R^1$  and  $R^3$  are the same or different, and each represents an optionally substituted alkyl group, and  $R^2$ ,  $R^4$  and  $R^5$  are the same or different, and each represents a hydrogen atom or an optionally substituted alkyl group.

[0011]

Herein, examples of the alkyl group include a straight chain, branched chain or cyclic C1-20 alkyl group such as a methyl group, an ethyl group, an n-propyl group, an isopropyl

group, an n-butyl group, an isobutyl group, a sec-butyl group, a tert-butyl group, an n-pentyl group, an n-decyl group, a cyclopropyl group, a 2,2-dimethylcyclopropyl group, a cyclopentyl group, a cyclohexyl group and a menthyl group. The alkyl group may be substituted with a C1-20 alkoxy group which may be substituted such as a methoxy group, an ethoxy group, an n-propoxy group, an isopropoxy group, an n-butoxy group, an isobutoxy group, a sec-butoxy group, a tert-butoxy group and a trifluoromethoxy group; a C6-20 aryl group which may be substituted such as a phenyl group, a 4-methylphenyl group and 4-methoxyphenyl group; a C6-20 aryloxy group which may be substituted such as a phenoxy group, a 2-methylphenoxy group, a 4-methylphenoxy group, a 4-methoxyphenoxy group and a 3-phenoxyphenoxy group; a C7-20 aralkyloxy group which may be substituted such as a benzyloxy group, a 4-methylbenzyloxy group, a 4-methoxybenzyloxy group and a 3-phenoxybenzyloxy group; a fluorine atom; a C2-20 alkylcarbonyl group which may be substituted such as an acetyl group and an ethylcarbonyl group; a C7-20 arylcarbonyl group which may be substituted such as a benzoyl group, a 2-methylbenzoyl group, a 4-methylbenzoyl group and a 4-methoxybenzoyl group; a C8-20 aralkylcarbonyl group which may be substituted such as a benzylcarbonyl group, a 4-methylbenzylcarbonyl group and a 4-methoxybenzylcarbonyl group; or a carboxyl group. Examples of the alkyl group substituted with the substituent include a fluoromethyl group, a trifluoromethyl group, a methoxymethyl group, an ethoxymethyl group and a methoxyethyl group.

[0012]

Examples of the alkyl-substituted imidazolium fluoride

(1) include 1,3-dimethylimidazolium fluoride, 1,2,3-trimethylimidazolium fluoride, 1,2,3,4-tetramethylimidazolium fluoride, 1,2,3,4,5-pentamethylimidazolium fluoride, 1-methyl-3-ethylimidazolium fluoride, 1,2-dimethyl-3-ethylimidazolium fluoride, 1,3-diethylimidazolium fluoride, 1-methyl-3-(n-propyl)imidazolium fluoride, 1-methyl-3-(n-butyl)imidazolium fluoride, 1,2-dimethyl-3-(n-butyl)imidazolium fluoride, 1-methyl-3-(n-pentyl)imidazolium fluoride, 1-methyl-3-(n-hexyl)imidazolium fluoride, 1,3-dimethyl-2-ethylimidazolium fluoride, 1,3-dimethyl-2-(n-propyl)imidazolium fluoride, 1,3-dimethyl-2-(n-butyl)imidazolium fluoride, 1-dodecyl-2-methyl-3-dodecylimidazolium fluoride, 1-dodecyl-2-methyl-3-benzylimidazolium fluoride, 1-ethoxymethyl-3-methylimidazolium fluoride and 1-trifluoromethyl-3-methylimidazolium fluoride. These may form a complex with an inert compound on the nucleophilic substitution fluorination reaction such as water and a polar solvent.

[0013]

The alkyl-substituted imidazolium fluoride (1) can be produced, for example, by using a method such as a reaction of an alkyl-substituted imidazolium chloride compound and a silver fluoride.

[0014]

Next, the fluorination reaction of an organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction using the alkyl-substituted imidazolium fluoride (1) will be illustrated.

[0015]

Examples of the organic compound having one or two or

more substituents subjected to a nucleophilic substitution fluorination reaction include an organic compound wherein one or two or more hydrogen atoms on a saturated hydrocarbon, which may be substituted, are substituted with a substituent subjected to a nucleophilic substitution fluorination reaction; and

an organic compound wherein one or two or more hydrogen atoms on an optionally substituted aromatic compound are substituted with a substituent subjected to a nucleophilic substitution fluorination reaction. They are converted to the corresponding organic compound wherein one or two or more hydrogen atoms on a saturated hydrocarbon, which may be substituted, are substituted with a fluorine atom; and

an organic compound wherein one or two or more hydrogen atoms on an optionally substituted aromatic compound are substituted with a fluorine atom, respectively.

[0016]

Examples of the saturated hydrocarbon include a straight chain, branched chain or cyclic C1-C20 alkane such methane, ethane, propane, n-butane, isobutane, n-pentane, n-decane, cyclopropane, 2,2-dimethylcyclopropane, cyclopentane and cyclohexane. The saturated hydrocarbon may be substituted with an optionally substituted C5-C20 aryl group such as a phenyl group, a 1-naphthyl group, a 2-naphthyl group, a 4-methylphenyl group, a 4-methoxyphenyl group, a 3-phenoxyphenyl group, a 2,3,5,6-tetrafluorophenyl group, a 2,3,5,6-tetrafluoro-4-methylphenyl group, a 2,3,5,6-tetrafluoro-4-methoxyphenyl group, a 2,3,5,6-tetrafluoro-4-methoxymethylphenyl group and a 2-pyridyl group; an optionally substituted C1-C20 alkoxy group

such as a methoxy group, an ethoxy group, an n-propoxy group, an isopropoxy group, an n-butoxy group, an isobutoxy group, a sec-butoxy group, a tert-butoxy group and a trifluoromethoxy group; an optionally substituted C6-C20 aryloxy group such as a phenoxy group, a 2-methylphenoxy group, 4-methylphenoxy group, 4-methoxyphenoxy group and 3-phenoxyphenoxy group; an optionally substituted C7-C20 aralkyloxy group such as a benzyloxy group, a 4-methylbenzyloxy group, a 4-methoxybenzyloxy group, a 3-phenoxybenzyloxy group, a 2,3,5,6-tetrafluorobenzyloxy group, a 2,3,5,6-tetrafluoro-4-methylbenzyloxy group, a 2,3,5,6-tetrafluoro-4-methoxybenzyloxy group and a 2,3,5,6-tetrafluoro-4-methoxymethylbenzyloxy group; a fluorine atom; an optionally substituted C2-C20 alkylcarbonyl group such as an acetyl group and an ethylcarbonyl group; an optionally substituted C7-C20 arylcarbonyl group such as a benzoyl group, a 2-methylbenzoyl group, a 4-methylbenzoyl group and a 4-methoxybenzoyl group; an optionally substituted C8-C20 aralkylcarbonyl group such as a benzylcarbonyl group, a 4-methylbenzylcarbonyl group and a 4-methoxybenzylcarbonyl group; a carboxyl group; or the like. Examples of the saturated hydrocarbon which is substituted with the substituent include a fluoromethane, trifluoromethane, methoxymethane, ethoxymethane, methoxyethane, toluene, 4-methoxytoluene, 3-phenoxytoluene, 2,3,5,6-tetrafluorotoluene, 2,3,5,6-tetrafluoro-paraxylene, 2,3,5,6-tetrafluoro-4-methoxytoluene and 2,3,5,6-tetrafluoro-4-methoxymethyltoluene.

[0017]

Examples of the aromatic compound include a hydrocarbon type aromatic compound such as benzene and naphthalene, and a

heteroaromatic compound such as pyridine and quinoline. The aromatic compound may be substituted with an optionally substituted C5-C20 aryl group such as a phenyl group, a 1-naphthyl group, a 2-naphthyl group, a 4-methylphenyl group, a 4-methoxyphenyl group, a 3-phenoxyphenyl group, a 2,3,5,6-tetrafluorophenyl group, a 2,3,5,6-tetrafluoro-4-methylphenyl group, a 2,3,5,6-tetrafluoro-4-methoxyphenyl group, a 2,3,5,6-tetrafluoro-4-methoxymethylphenyl group and a 2-pyridyl group; an optionally substituted C1-C20 alkoxy group such as a methoxy group, an ethoxy group, an n-propoxy group, an isopropoxy group, an n-butoxy group, an isobutoxy group, a sec-butoxy group, a tert-butoxy group and a trifluoromethoxy group; an optionally substituted C6-C20 aryloxy group such as a phenoxy group, a 2-methylphenoxy group, 4-methylphenoxy group, 4-methoxyphenoxy group and 3-phenoxyphenoxy group; an optionally substituted C7-C20 aralkyloxy group such as a benzyloxy group, a 4-methylbenzyloxy group, a 4-methoxybenzyloxy group, a 3-phenoxybenzyloxy group, a 2,3,5,6-tetrafluorobenzyloxy group, a 2,3,5,6-tetrafluoro-4-methylbenzyloxy group, a 2,3,5,6-tetrafluoro-4-methoxybenzyloxy group and a 2,3,5,6-tetrafluoro-4-methoxymethylbenzyloxy group; an optionally substituted C2-C20 alkylcarbonyl group such as an acetyl group and an ethylcarbonyl group; an optionally substituted C7-C20 arylcarbonyl group such as a benzoyl group, a 2-methylbenzoyl group, a 4-methylbenzoyl group and a 4-methoxybenzoyl group; an optionally substituted C8-C20 aralkylcarbonyl group such as a benzylcarbonyl group, a 4-methylbenzylcarbonyl group and a 4-methoxybenzylcarbonyl group; a carboxyl group; a sulfonamide group; a cyano group; an amide group; a fluorine atom; or the

like. Alternatively, neighboring substituents among these substituents may be bonded each other to form a ring together with carbon atoms to which they are bonded. Among substituents which the aromatic compound may have, an electron withdrawing substituent is preferable in terms of the reactivity. Examples of the electron withdrawing substituent include a fluorine atom, an optionally substituted alkylcarbonyl group, an optionally substituted aralkylcarbonyl group, an optionally substituted arylcarbonyl group, a carboxyl group, a sulfonamide group and a cyano group. Examples of the aromatic compound substituted with the substituent include cyanobenzene, terephthalonitrile, isophthalonitrile and orthophthalonitrile.

[0018]

Examples of the substituent subjected to the nucleophilic substitution fluorination reaction, which is substituted with a hydrogen atom on the saturated hydrocarbon or the aromatic compound, include a chlorine atom, a bromine atom, an iodine atom, a nitro group, a sulfo group, an optionally substituted alkylsulfonyloxy group, an optionally substituted arylsulfonyloxy group, an optionally substituted alkylcarbonyloxy group and an optionally substituted arylcarbonyloxy group. In the case of having two or more substituents, these may be same or different from each other.

[0019]

Examples of the optionally substituted alkylsulfonyloxy group include a methanesulfonyloxy group, an ethanesulfonyloxy group and a trifluoromethanesulfonyloxy group. Examples of the optionally substituted arylsulfonyloxy group include a paratoluenesulfonyloxy group, a benzenesulfonyloxy group and a

1-naphthalenesulfonyloxy group. Examples of the optionally substituted alkylcarbonyloxy group include a trifluoroacetoxy group and a pentafluoroethylcarbonyloxy group. Examples of the optionally substituted arylcarbonyloxy group include a tetrafluorobenzoyloxy group and a benzoyloxy group.

[0020]

Examples of the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction include 1-chlorobutane, 1-bromobutane, 1-iodobutane, 1-chlorocyclobutane, 1-chloropentane, 1-bromopentane, 1-chlorocyclopentane, 1-chloro-4-bromobutane, 1-chlorohexane, 1-bromohexane, 1,6-dibromohexane, 1-chloroheptane, 1-bromoheptane, 1-chlorooctane, 1-bromooctane, benzyl chloride, benzyl bromide, 4-methoxybenzyl chloride, 4-methylbenzyl bromide, 3,4,5-trifluorobenzyl bromide, n-butyl paratoluenesulfonate, n-butyl methanesulfonate, n-pentyl paratoluenesulfonate, n-pentyl methanesulfonate, n-hexyl paratoluenesulfonate, n-hexyl methanesulfonate, n-heptyl paratoluenesulfonate, n-heptyl methanesulfonate, n-octyl paratoluenesulfonate, n-octyl methanesulfonate, n-butyl trifluoroacetate, n-butyl tetrafluorobenzoate, n-octyl trifluoroacetate, 4-chloronitrobenzene, 4-bromonitrobenzene, 2-chloronitrobenzene, 2-bromonitrobenzene, 4-cyanochlorobenzene, 4-cyanobromobenzene, 1-chloro-2,4-dinitrobenzene, tetrachloroterephthalonitrile, tetrachloroisophthalonitrile, tetrachloroorthophthalonitrile, 1,3-dichloro-4,6-dinitrobenzene, 2-chloroquinoline, 2-chloro-5-nitropyridine and 2-chloro-5-trifluoromethylpyridine.

[0021]

In the present invention, a fluorine-containing compound can be obtained by reacting the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction with the alkyl-substituted imidazolium fluoride (1). Herein, when the organic compound having two or more substituents subjected to a nucleophilic substitution fluorination reaction is used, those may be different substituents and the reactivity is usually shown as following; only the highest reactive substituent is sometimes substituted with a fluorine atom and same or different two or more substituents are sometimes substituted with fluorine atoms.

[0022]

In the reaction of the organic compound wherein one or two or more hydrogen atoms on an optionally substituted aromatic compound are substituted with the substituent subjected to a nucleophilic substitution fluorination reaction, when the optionally substituted aromatic compound is the hydrocarbon type aromatic compound, the substituent subjected to a nucleophilic substitution fluorination reaction, which has an electron-withdrawing group on para- or ortho-position, is usually preferentially substituted with a fluorine atom. For example, in the reaction of 4-chloronitrobenzene, although both of the chlorine atom and the nitro group are substituents subjected to a nucleophilic substitution fluorination reaction, the chlorine atom having higher electron-withdrawing nitro group on para-position is preferentially substituted with a fluorine atom and 4-fluoronitrobenzene is usually selectively produced. Off course, the nitro group can be also substituted with a fluorine atom by selecting accordingly reaction

conditions such as use of a large excess of the alkyl-substituted imidazolium fluoride (1), and paradifluorobenzene can be also obtained.

[0023]

Alternatively, in the reaction of the organic compound wherein one or two or more hydrogen atoms on an optionally substituted aromatic compound are substituted with the substituent subjected to a nucleophilic substitution fluorination reaction, when the optionally substituted aromatic compound is the heteroaromatic compound, the substituent subjected to a nucleophilic substitution fluorination reaction on the 2-, 4- or 6-position for the heteroatom constituting the heteroaromatic ring, is usually preferentially substituted with a fluorine atom. For example, in the case of 2-chloro-3-nitropyridine, the chlorine atom on 2-position is usually substituted to yield 2-fluoro-3-nitropyridine. Off course, the nitro group can be also substituted with a fluorine atom by selecting accordingly reaction conditions such as use of a large excess of the alkyl-substituted imidazolium fluoride (1), and 2,3-difluoropyridine can be also obtained.

[0024]

The used amount of the alkyl-substituted imidazolium fluoride (1) is usually 1 mole or more per 1 mole of the substituent desired to substitute with a fluorine atom on the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction. While there is no upper limit particularly, when the compound has only one substituent subjected to a nucleophilic substitution fluorination reaction, it is preferably in a range

of about 1.5 to 5.0 moles per 1 mole of the substituent subjected to a nucleophilic substitution fluorination reaction from the viewpoint of the reaction efficiency. Alternatively, when the compound has two or more substituents subjected to a nucleophilic substitution fluorination reaction, the used amount thereof may be accordingly set in a range wherein the substituent, which is not desired to subject to the fluorination reaction, is not substituted with a fluorine atom based on the above-mentioned priority of the reactivity.

[0025]

The present invention can be carried out in the presence of an organic solvent, water or a mixture thereof, and can be also carried out in the absence of the solvent.

[0026]

Examples of the organic solvents in the case of being carried out using the solvent include ether solvents such as methyl tert-butyl ether and tetrahydrofuran; nitrile solvents such as acetonitrile and propionitrile; aromatic hydrocarbon solvents such as toluene and xylene; aliphatic hydrocarbon solvents such as cyclohexane and n-heptane; amide solvents such as dimethylformamide and dimethylacetamide; and sulfur-containing solvents such as sulfolane and dimethylsulfoxide.

[0027]

When the solvent is used, the used amount thereof is not particularly limited, and it is practically about 100 parts by weight or less per 1 part by weight of the alkyl-substituted imidazolium fluoride (1) in consideration of volumetric efficiency.

[0028]

When the reaction temperature is too low, the reaction hardly proceeds and, when the reaction temperature is too high, side reaction such as degradation of the starting material or product may proceed. Therefore, the practical reaction temperature is usually a range of about -20 to 200°C.

[0029]

The mixing order of the reaction agents is not particularly limited. For example, the alkyl-substituted imidazolium fluoride (1) may be added to the organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction under the reaction temperature condition and the reaction may be carried out in the reverse order. The reaction temperature may be adjusted after mixing both agents simultaneously.

[0030]

The present reaction may be carried out at normal pressure and under pressure. Alternatively, the progress of the reaction can be checked by a conventional analytical means such as gas chromatography, high performance liquid chromatography, thin layer chromatography, NMR and IR.

[0031]

After completion of the reaction, the fluorine-containing compound which is the reaction product can be isolated by conducting crystallization treatment, distillation or concentration of the organic layer obtained by extracting, if necessary by adding water and/or a water-insoluble solvent thereto. The fluorine-containing compound isolated may be further purified by a means such as distillation or column chromatography.

[0032]

Herein, examples of the water-insoluble solvents include aromatic hydrocarbon solvents such as toluene, xylene and chlorobenzene; aliphatic hydrocarbon solvents such as pentane, hexane and heptane; halogenated hydrocarbon solvents such as dichloromethane, dichloroethane and chloroform; ether solvents such as diethyl ether, methyl tert-butyl ether and tetrahydrofuran; and ester solvents such as ethyl acetate.

[0033]

Examples of the fluorine-containing compound thus obtained include 1-fluorobutane, 1-fluorocyclobutane, 1-fluoropentane, 1-fluorocyclopentane, 1,4-difluorobutane, 1-chloro-4-fluorobutane, 1-fluorohexane, 1,6-difluorohexane, 1-fluoroheptane, 1-fluorooctane, benzyl fluoride, 4-methoxybenzyl fluoride, 4-methylbenzyl fluoride, 3,4,5-trifluorobenzyl fluoride, 4-fluoronitrobenzene, 2-fluoronitrobenzene, 4-cyanofluorobenzene, 1-fluoro-2,4-dinitrobenzene, tetrafluoroterephthalonitrile, tetrafluoroisophthalonitrile, tetrafluoroorthophthalonitrile, 1,3-difluoro-4,6-dinitrobenzene, 2-fluoroquinoline, 2-fluoro-5-nitropyridine and 2-fluoro-5-trifluoromethylpyridine.

[0034]

After the reaction, the alkyl-substituted imidazolium cation can be recovered as the alkyl-substituted imidazolium salt wherein an anion is the substituent subjected to the nucleophilic substitution fluorination reaction. The alkyl-substituted imidazolium salt recovered by filtration treatment or separation treatment from the reaction liquid, can be reused as the alkyl-substituted imidazolium fluoride (1) by exchanging

the ion to fluoride ion again.

[Example]

[0035]

The present invention will be further illustrated in more detail by Examples. The present invention is not limited to these Examples.

[0036]

Example (Example of synthesis of the alkyl-substituted imidazolium fluoride (1))

Into an Erlenmeyer flask, 22 g of 1-methyl-3-(n-butyl)imidazolium chloride and 200 g of water were charged and dissolved. After 16.1 g of silver(I) fluoride and 120 g of water were charged into another Erlenmeyer flask to be dissolved, two aqueous solutions were mixed at 25°C and the stirring was continued for 30 minutes at the same temperature. The crystalline precipitated after the reaction was filtered and washed with water. The filtrate and wash liquid obtained were joined and concentrated to obtain 24.5 g of 1-methyl-3-(n-butyl)imidazolium fluoride dihydrate. Yield: 100%.

[0037]

Example 1

Into a 50 mL flask equipped with a reflux condenser, 500 mg of 1-methyl-3-(n-butyl)imidazolium fluoride dihydrate and 171 mg of benzyl bromide were charged to stir for 5 hours at 80°C. After cooling to room temperature, 5 g of ethyl acetate was added to the mixture to stir. The mixture was separated to two layers by standing. The upper layer was analyzed by gas chromatography (internal standard method) to find out that the main product was benzyl fluoride. Yield: 95%.

[0038]

Example 2

The reaction was conducted according to the same manner as that described in Example 1, except that 284 mg of n-octyl paratoluenesulfonate was used in place of 171 mg of benzyl bromide used and the mixture was stirred for 3 hours at 150°C. The main product was 1-fluorooctane. Yield: 98%.

[0039]

Example 3

The reaction was conducted according to the same manner as that described in Example 1, except that 193 mg of 1-bromooctane was used in place of 171 mg of benzyl bromide used and the mixture was stirred for 3 hours at 100°C. The main product was 1-fluorooctane. Yield: 90%.

[0040]

Example 4

The reaction was conducted according to the same manner as that described in Example 1, except that 158 mg of 4-chloronitrobenzene was used in place of 171 mg of benzyl bromide used and the mixture was stirred for 3 hours at 150°C. The main product was 4-fluoronitrobenzene. Yield: 88%.

[Title of Document] ABSTRACT

[Abstract]

[Problem] It is to provide an industrially advantageous method for producing a fluorine-containing compound.

[Means to Solve] A method for producing a fluorine-containing compound comprising reacting an organic compound having one or two or more substituents subjected to a nucleophilic substitution fluorination reaction with an alkyl-substituted imidazolium fluoride represented by the formula (1):

[Formula 1]

wherein R<sup>1</sup> and R<sup>3</sup> are the same or different, and each represents an optionally substituted alkyl group, R<sup>2</sup>, R<sup>4</sup> and R<sup>5</sup> are the same or different, and each represents a hydrogen atom or an optionally substituted alkyl group.
